HTML/CSS/PHP Output from Driver:

The basics of the HTML output class has been created and tested. It currently outputs the new html documents into the output folder of the project. Later we will need to update the output directory to match the cPanel file structure and link them so the files get updated as the user updates their data.

```
html_output::createTestPage()
{
    ofstream testPageOne;
// *******This currently outputs the file into the output folder of the project******
    testPageOne.open ("./output/HTML/testPageOne.html");
```
